Dragon Amulet

How to install the game on a Mac or a Windows PC

Dragon Amulet is free. The desktop app is not signed by Apple or Microsoft yet (signing costs a yearly fee), so the first time you open it your computer shows a warning about an unknown app. The steps below tell your computer you trust it. **You only do this once.** After that the game opens like any other app, and it updates itself to the newest version each time it starts.

> **Want to skip installing?** The game also runs in a web browser on any computer, phone or tablet, with nothing to approve: https://pumped60.github.io/dragon-amulet-play/

Step 1: download the app

Open this page: https://github.com/pumped60/dragon-amulet-play/releases/latest

Scroll down to **Assets** and click the file for your computer:

Mac (any Mac from 2017 on, Intel or Apple chip)	`Dragon-Amulet-...-mac.dmg`
Windows (Windows 10 or 11), installs with a Start menu icon	`Dragon-Amulet-Setup-....exe`
Windows, no install (runs from wherever you keep the file)	`Dragon-Amulet-...-portable.exe`

The dots stand for the version number, which changes with each update.

On a Mac

1. Open the **.dmg** file you downloaded (it is in your Downloads folder). A window opens: drag **Dragon Amulet** onto the **Applications** folder.
2. Open your **Applications** folder and double-click **Dragon Amulet**. A message says the app could not be checked or verified by Apple. Click **Done** (or **OK**). **Do not click Move to Trash.**
3. Open **System Settings** (Apple menu at the top left) and click **Privacy & Security**. Scroll down to the **Security** part. You will see *"Dragon Amulet" was blocked*. Click **Open Anyway**.
4. Type your Mac password (or use Touch ID) if it asks, then click **Open Anyway** once more. The game starts.
5. That is all. From now on, open Dragon Amulet from Applications or Launchpad like any other app.

On an older Mac (macOS Sonoma or earlier) there is a quicker way: in Applications, hold **Control** and click Dragon Amulet (or right-click it), choose **Open**, then click **Open** in the message.

If the Mac says "Dragon Amulet is damaged and can't be opened"

The file is fine; this is how newer Macs treat downloaded apps that are not signed. To fix it:

1. Open **Terminal** (Applications, then Utilities, then Terminal).
2. Copy this line exactly, paste it into Terminal and press **Return**:

```
xattr -cr "/Applications/Dragon Amulet.app"
```

3. Close Terminal and open Dragon Amulet again. If it still asks, do steps 3 and 4 above.

On a Windows PC

Keeping the download

Your browser may say the file "isn't commonly downloaded" and offer to delete it.

1. **Microsoft Edge:** open the downloads list (the arrow at the top right), point at the file, click the **three dots**, choose **Keep**, then **Show more** and **Keep anyway**.
2. **Google Chrome:** in the download message, click **Keep** (or open the downloads list and choose **Keep** next to the file).

Installing and the blue "Windows protected your PC" screen

1. Double-click **Dragon-Amulet-Setup** in your Downloads folder.
2. A blue screen says *Windows protected your PC*. Click the small **More info** link, then click **Run anyway**.
3. If Windows asks whether to allow the app to make changes, click **Yes**.
4. In the installer, click **Next** (you can change the folder if you like), then **Install**, then **Finish**.
5. Start the game from the **Start menu** or the **desktop icon**. The blue screen does not come back.

Using the portable version instead? Move the **portable .exe** somewhere you will find it again (Documents or the desktop), double-click it, and do the same **More info**, then **Run anyway** step. Nothing is installed; the game runs from that file each time.

If your antivirus removes the file, open **Windows Security**, then **Virus & threat protection**, then **Protection history**. Find Dragon Amulet, choose **Allow on device**, and download it again.

Good to know

- **Updates are automatic.** Each time the game starts with an internet connection, it fetches the newest version. Without internet it plays the last version it has.
- **Your worlds are saved on your computer.** Uninstalling the app does not delete them.
- **Full screen:** press **F11** on Windows, or **Control + Command + F** on a Mac.
- **Playing with friends:** open Multiplayer in the game, host a world, and send your friends the code it shows.
- **Why the warnings?** Apple and Microsoft show them for any app that is not signed with a paid certificate. The app is built automatically by GitHub from the game's public files; the warning does not mean anything was found in it.
- **Problems?** In the game, open the pause menu (or the title screen) and choose **Report a bug**.
